All proprietary connections and elements shall be installed in accordance with the manufacturers' recommendations.
All work shall be accomplished in a workmanlike manner and in accordance with the applicable codes and local ordinances.
The general contractor is responsible for coordination of all work, including layout and dimension verification, materials coordination, shop drawing review, and the work of subcontractors. Any discrepancies or omissions discovered in the course of the work shall be immediately reported to the architect and structural engineer for resolution. Continuation of work without notification of discrepancies relieves the architect and structural engineer from all consequences.
Unless otherwise specifically indicated, the structural drawings do not describe methods of construction.
The general contractor, in the proper sequence, shall perform or supervise all work necessary to achieve the final completed structure, and to protect the structure, workmen, and others during construction. Such work shall include, but not be limited to temporary bracing, shoring for construction equipment, shoring for excavation, formwork, scaffolding, safety devices and programs of all kinds, support and bracing for cranes and other erection equipment.
Do not backfill against basement or retaining walls until supporting slabs and floor framing are in place and securely anchored, unless adequate temporary bracing is installed.
Temporary bracing shall remain in place until all floors, walls, roofs and any other supporting elements are in place.
The architect and structural engineer bear no responsibility for the above items, and observation visits to the site do not in any way include inspections of these items.
These plans have been engineered for construction at one specific building site. Builder assumes ALL responsibility for use of these plans at ANY OTHER building site. Plans shall not be used for construction at any other building site without specific review by the engineer.

PRECAUTIONARY NOTES ON STRUCTURAL BEHAVIOR:
Interior architectural finish detailing must accommodate the relative differential movements of supporting structural elements.
Where the roof framing element spans are long, applied loading will naturally cause substantial deflection. Interior elements hung from the roof structure will deflect with the roof.
The floor is a floating concrete slab-on-grade and may experience movements independent of the structural foundations. Interior elements supported on the slab-on-grade floor will move with the floor. Interior elements supported on foundations and columns will not experience similar or measurable movements.
Exterior/perimeter wall assemblies hung from the edge of the building structure will be directly affected (to some degree) by changes in external temperature and floor deflection.
Exterior/perimeter and interior architectural finish details should allow for relative movements between elements with different support conditions.
The foundation design shown assumes that the owner/builder is aware of the presence of expansive soils, and that he has read the previously referenced soils report. Use of these plans is indication that the owner/builder accepts the risks associated with building on this site, especially those related to slab on grade construction in finished areas. Anthem, LLC will not be held liable for damages caused by slab movement.

LETTERS OF CONSTRUCTION COMPLIANCE:
The general contractor shall determine from the local building authority, at the time the building permit is obtained, whether any letters of construction compliance will be requested from the structural engineer.
The contractor shall notify the structural engineer of all such requirements in writing prior to the start of construction.
Two day advance notice shall be given when requesting site visits necessary as the basis for the compliance letter.
The general contractor shall provide copies of all third-party testing and inspection reports to the architect and structural engineer a minimum of one week prior to the date that the compliance letter is needed.

INSPECTIONS:
Inspections and Testing shall be performed by a qualified Inspector in accordance with IRC section R109.
The Inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for inspection of the particular type of construction or operation requiring inspection.
Except as noted, the inspections outlined in the IRC are in addition to, and beyond the scope of, periodic Structural Observations. Structural Observations are included in the structural engineering design and construction administration services provided by the structural engineer.

DESIGN ALL ROOF TRUSSES TO CLEAR SPAN TO BEARING WALLS AND SUPPORT BEAMS AS INDICATED ON PLAN.

DESIGN LOADS ARE AS FOLLOWS:
- DEAD LOAD BOTTOM CHORD: 10 PSF
- DEAD LOAD TOP CHORD: 10 PSF
- SNOW LOAD TOP CHORD: 96.6 + DRIFT PSF
- UNINHABITABLE ATTIC WITH STORAGE LIVE LOAD: 20 PSF

LIMIT DEFLECTIONS TO:
- SPAN/360 FOR LIVE LOAD
- SPAN/240 FOR TOTAL LOAD

ALSO DESIGN TRUSSES FOR DRAG, POINT AND UNIFORM LOADS CALLED OUT ON PLANS.

ALL TRUSS TO TRUSS CONNECTIONS TO BE DESIGNED AND SUPPLIED BY THE TRUSS MANUFACTURER UNO. TRUSS FABRICATOR SHALL SUBMIT SHOP DRAWINGS AND CALCULATIONS STAMPED BY A REGISTERED PROFESSIONAL ENGINEER IN THE STATE IN WHICH THE PROJECT IS LOCATED TO ENGINEER OF RECORD (EOR) FOR REVIEW PRIOR TO FABRICATION.

REFER TO ARCHITECTURAL DRAWINGS FOR TRUSS HEEL HEIGHTS AND PROFILES.

DO NOT ALTER TRUSS LAYOUT WITHOUT EOR PRIOR APPROVAL.

BEARING DESIGN SHALL ASSUME DOUG-FIR WALL TOP PLATES (625 psi). USE MULTIPLE PLIES, BEARING BLOCKS, OR BEARING ENHANCERS TO ACCOMMODATE BEARING LENGTHS PER PLAN. THE USE OF END GRAIN BEARING IS NOT ACCEPTABLE. UNLESS SPECIFICALLY APPROVED BY THE EOR FOR THE PROJECT.
